ABSTRACTED-PUB-NO: WO 200018375A
BASIC-ABSTRACT:

NOVELTY - The use of polymers (I), obtained by graft polymerization of vinyl esters of aliphatic carboxylic acids onto polyethers (II), as coating agent, binder and/or film-former in pharmaceutical dosage forms is new. Some (I) are new compounds.

DETAILED DESCRIPTION - The use of polymers (I), obtained by polymerization of at least one vinyl ester of a 1-24C aliphatic carboxylic acid in presence of a polyether of

formula (II), is claimed as coating agent, binder and/or film-forming auxiliary in pharmaceutical dosage forms.

R1 = H, R9, R9C(O)-, R9NHC(O)- or a polyol residue;

R8 = H, R9, R9C(O)- or R9NHC(O)-;

R2-R7 = (CH₂)₂, (CH₂)₃, (CH₂)₄, CH₂CH(Me), CH₂CH(Et) or CH₂CH(OR₁₀)CH₂;

R9 = 1-24C alkyl;

R₁₀ = H, R9 or R9C(O)-;

A = C(O)O, C(O)-B-C(O)O or C(O)NH-B-C(O)O;

B = (CH₂)_t or arylene (optionally substituted);

n = 1-8;

s = 0-500;

t = 1-12;

u, x = 1-5000;

v, w, y, z = 0-5000.

INDEPENDENT CLAIMS are included for:

(a) pharmaceutical dosage forms containing (I); and

(b) new polymers (I'), as defined for (I) above provided that:

(i) R1 and R8 are other than R9NHC(O)-, A is other than C(O)NH-B-C(O)O and s is other than 0;

(ii) R1 and R8 are other than R9NHC(O)-, R2-R4 are other than CH₂CH(OR₁₀)CH₂, A is other than C(O)NH-B-C(O)O, s = 0 and (I) also contain units derived from at least further monomer (III) selected from 3-8C monoethylenically unsaturated carboxylic acids (or their 1-24C alkyl or 1-24C hydroxyalkyl esters), 1-24C alkyl-vinyl ethers or N-vinyl-lactams; or

(iii) (II) is a polyglycerol in which R2 = CH₂CH(OR₁₀)CH₂; s, v, w = 0; u = 1-2000; and

R1 and R8 are other than R9NHC(O).

USE - (I) are typically useful as: (1) coatings for film tablets, film micro-tablets, dragees, pastilles, capsules, pellets, granules or crystals); (2) binders for tablets, microtablets, cores, granules or pellets; or (3) film-formers in solutions or sprays for application to the skin or mucosa, e.g. for wound treatment or transdermal drug delivery. (I) may additionally serve as protective colloids; wetting and solubilizing agents in disperse systems; agents for improving the solubility, dissolution speed, resorption and bioavailability of sparingly water-soluble drugs; dispersion or suspension auxiliaries; emulsifiers; crystallization or caking inhibitors; bioadhesives; spreading auxiliaries; viscosity regulators; auxiliaries in the preparation of solid drug solutions; release auxiliaries in retard formulations; or (in the case of water-insoluble but water-dispersible polymers) retard polymers or adhesives for plasters. (I) may also be used in the preparation of suppositories or vaginal ovules.

ADVANTAGE - (I) are readily soluble or dispersible in gastric fluid. They have high flexibility, high elasticity (e.g. an extension at break of up to 300%) and low viscosity, and can generally be used without plasticizers. (I) give surfaces of low lipophilicity, and have good protective colloid properties. Powders, granules or

tablets having (I) as coating or binder dissolve or redisperse rapidly in water or gastric fluid, without forming agglomerates. Use of (I) as binder rather than hydroxypropyl methyl cellulose provides tablets having markedly higher mechanical strength and stability. (I) can be used for coating or binding in the form of concentrated preparations, to save time and expense.

ABSTRACTED-PUB-NO: EP 558423A

BASIC-ABSTRACT:

The compsn. comprises; (A) a fluorinated phase contg. organo fluorohydrocarbon cpd(s). (I) comprises a hydrocarbon in which at least 70 (at least 95) % of the H atoms are replaced by F; dispersed in (B) an aq. soln. of water-soluble film-forming

polymer(s) (II) free of -CH(OH)-CH₂- units.

Phase (A) pref. forms 0.01-70 (0.1-50) wt.% of the compsn.. Phase (A) opt. contains cpd(s). (I) solid at room temp. dissolved in cpd(s). (I) which is liq. at room temp.. Size of dispersed particles is pref. 0.2-50 (0.5-10) microns.

USE/ADVANTAGE - The compsn. is used as a gel, mask, cream, eyeliner, mascara, aq. nail varnish, aq. lacquer or temporary hair colouring prod.. (I) form films with high stability, suppleness and elasticity, reduced water sensitivity, reduced stickiness on contact with water and slower redissolution and a soft and pleasant (I) remains completely dispersent in the composite film.

ABSTRACTED-PUB-NO:

EP 558423B

EQUIVALENT-ABSTRACTS:

Cosmetic of dermatological composition in the form of an oil-in-water dispersion capable of forming a composite film by evaporation of the aqueous phase, characterized in that it comprises a fluorine-containing phase consisting of at least one organic fluorine-containing hydrocarbon compound which is a hydrocarbon at least 70 % and preferably at least 95 % of whose hydrogen atoms have been substituted by fluorine atoms, the said phase being dispersed in an aqueous solution of at least one water-soluble film-forming polymer devoid of units of the following formula (I);

ABSTRACTED-PUB-NO: DE 4403866A
BASIC-ABSTRACT:

Amphiphilic polyesters with a mol. wt. of 1500-25,000 (I) contain blocks of (a) ester units derived from (a1) polyalkylene glycols with a mol.wt. of 500-7500 and (a2) aliphatic dicarboxylic acids and/or monohydroxy-monocarboxylic acids, and (b) ester units derived from aromatic di-acids and polyhydric alcohols.

Also claimed is a prepn. of (I), by polycondensation of (a1) with (a2) followed by prepn. of polyester (b) in the presence of the resulting aliphatic polyester (a), or by reversing the sequence of polycondensation or by condensing an oligomeric polyester (b) with an oligomeric polyester (a).

Pref. wt. ratio of ester units (a):(b) = (5:1)-(1:2), pref. (3:1)-(1:1).

USE - Used as additives in detergents and in other detergent additives and after-wash treatment materials (claimed).

ADVANTAGE - Provides new detergent additives with good dirt removing properties and better biodegradability than corresp. polyesters based on aromatic acids only.

ABSTRACTED-PUB-NO:

EP 743962B

EQUIVALENT-ABSTRACTS:

Amphiphilic polyesters with a mol. wt. of 1500-25,000 (I) contain blocks of (a) ester units derived from (a1) polyalkylene glycols with a mol.wt. of 500-7500 and (a2) aliphatic dicarboxylic acids and/or monohydroxy-monocarboxylic acids, and (b) ester units derived from aromatic di-acids and polyhydric alcohols.

Also claimed is a prepn. of (I), by polycondensation of (a1) with (a2) followed by prepn. of polyester (b) in the presence of the resulting aliphatic polyester (a), or by reversing the sequence of polycondensation or by condensing an oligomeric polyester

(b) with an oligomeric polyester (a).

AB Disclosed is a graft polymer comprising a polyurethane graft backbone and grafted-on chains comprising vinyl alcohol units and units with lateral styrylpyridinium or styrylquinolinium groups, and also a photocurable mixture comprising the graft polymer and a photosensitive compound, such as a photosensitizer of a negative-working diazo compound. The mixture is suited for the production of printing plates, in particular planographic printing plates, and photoresists. Printing plates prepared from the mixture are distinguished by high photospeed, good developability with aqueous solutions and long print runs.

AB Disclosed is a photocurable mixture which is suited for the production of printing plates, in particular planographic printing plates, and photoresists. The mixture comprises a graft polymer comprised of a polyurethane as the graft backbone and grafted-on chains containing vinyl alcohol units and units with lateral, polymerizable or crosslinkable double bonds, and a photosensitive compound, such as a photoinitiator or a negative-working diazo compound.

The printing plates prepared from the mixture are distinguished by high photospeed, good developability with aqueous solutions and long print runs.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Polymers with polyvinyl acetal groups, which contain acetalized polyvinyl alcohol groups on polyurethane grafting substrates and which are prepared from graft polymers, containing vinyl alcohol groups on polyurethane grafting substrates, by reaction with aldehydes according to known methods. The aldehydes used can be any known aldehydes capable of acetalization reactions.

The polyurethane grafting substrates contain at least 2 urethane groups in the molecule and units from diisocyanates and diols, and polymer radicals of units of vinyl carboxylates having 3 to 20 carbon atoms and/or hydrolysis products thereof and, if appropriate, further monomer units are grafted onto the polyurethane grafting substrates. The proportion of vinyl alcohol units in the hydrolyzed or partially hydrolyzed graft polymers before the acetalization is >10% by weight.

In the acetalized polymer, the content of residual unacetalized vinyl alcohol units is >7.5 mol %, relative to the molar content (=100 mol %) of vinyl alcohol units in the starting graft polyvinyl alcohol before acetalization.

Use of the graft polyvinyl acetals as a constituent of coating compositions, as a coating agent constituent for the diverse substrates, as a material for thermoplastically processable moldings and as an interleaving film in laminated glasses.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
